## **polycarboxylic acid admixtures**

Admixtures are substances that can be added to concrete to achieve or change its properties.

In addition to cement, water and aggregate, admixtures are usually added to the concrete before or during the mixing process.

Admixtures can be used to reduce the cost of concrete construction or to ensure certain required performance or quality of solidified concrete.

If problems arise with concrete during construction, admixtures can be used as an emergency measure to try and prevent damage.

Concrete admixtures play an important role in the construction industry.

The need for various admixtures is based on the characteristics they exhibit and the area in which they

are used.

The construction industry is a major end user of the market, so fluctuations in the construction industry may directly affect the growth of the market.

The market is expected to be driven by an increasing number of commercial and residential construction projects, as well as an increasing number of infrastructure projects.
